# 7<sup>th</sup> Annual Chronic Disease Management Symposium

Integrated care is the provision of person centred care in which health services work with each other and with the person (and/or their carer) with a chronic condition to ensure coordination, consistency and continuity of care over time and through the different stages of the person's condition. Given the often complex nature of the needs of people with chronic conditions, their need for integrated care is perhaps the greatest. This Symposium aims to provide local staff with a forum that increases their knowledge and provides them with the skills to enhance integrated care for patients with chronic disease.
